Transanal Endoscopic Microsurgery-Peter Cataldo 2008-12-03 Cancer of the rectum continues to be a significant health problem in industrialized countries around the world. Relative 5-year survival rates in the USA for cancer of the rectum from 1995 to 2001 improved to 65%, a 15% improvement over 20 years (American Cancer Society, 2007). The reasons for this dramatic improvement include more accurate pre-operative staging, aggressive neoadjuvant therapy and improved surgical technique as well as specialty-trained surgeons. Despite advances in nonoperative techniques of radiation therapy, chemotherapy and immunotherapy, surgical extirpation continues to be the cornerstone of curative treatment of this potentially lethal disease. Radical cancer excision with total mesorectal excision has become the preferred surgical procedure for even early-stage cancers of the rectum.

Over the past decade the enthusiasm for local excision (and other local treatments) has given way to persuasive (predominantly retrospective) evidence that the incidence of locoregional recurrence due to unsuspected lymphatic metastases and positive lateral margins is unacceptably high even for stage T tumors. Vigorous attempts to find characteristics of the 1 tumor that would allow successful local treatments are ongoing.

Abdominal Wall Surgery-Dalila Patrizia Greco 2019-06-15 This book presents different patient-oriented perspectives from surgeons, economic evaluation and management researchers, and business companies active in the healthcare sector, striking a balance between the appropriateness/effectiveness of treatment and efficiency/cost. It does not include technical surgical details, but instead provides the necessary knowledge regarding different groups of patients to help economic and management researchers make accurate evaluations. It also analyzes different reimbursement systems and methods of data collection. This approach supports the evolution from evidence-based medicine (EBM) to the future of real-world data (big data analysis). Further, it highlights the critical issue of "silos" reimbursement, which is the pillar of DRG, and proposes methodology to evaluate the direct and indirect benefit and costs of surgery (for example quality of care, costs incurred in cases of surgical complications due to the use of inappropriate, low-cost material or due to surgical procedure.
